B BurbBuddy · Microburbs

THE MICROBURBS HACKATHON · CHROME EXTENSION

Compare the home. Understand the context.

BurbBuddy is the proposed name for a Microburbs-powered property research companion beside Australian listings.

THE BUYER PROBLEM

Biggest purchase. Fragmented research.

01

Listing details live here

Price guide, photos and campaign information help describe the home—but leave buyers comparing details across tabs.

02

Property context lives elsewhere

Buyers need a useful second reference for value and property basics, and a clear signal when information is missing.

03

Memory becomes the comparison tool

Switching between homes makes it harder to compare like with like and keep track of what is known.

> BurbBuddy puts Microburbs context beside the listing—right when the buyer is making a comparison.

THE CUSTOMER PROMISE

One listing. More useful context. Less guesswork.

VALUE

A second reference

See the Microburbs automated estimate and range beside the advertised guide, when available.

FACTS

Key basics together

Review returned bedrooms, bathrooms, parking and other supported property details in one place.

CLEAR

Honest about uncertainty

See confidence and estimate date when supplied. Missing facts stay missing—never made up.

> It is a comparison aid, not a formal valuation or a recommendation to buy.

SIMPLE BY DESIGN

From the listing address to a checked property match.

1

Open a home

Browse a supported Domain or realestate.com.au property listing.

2

Check address

Review the detected address or enter it yourself.

3

Verify match

Proceed only when one clear address match is found.

4

See available facts

Load the matched property's available Microburbs information.

5

Compare your way

Use the context alongside the listing; decide for yourself.

Trust by design: no property facts load for a non-match. The prototype uses the address for lookup and does not collect listing descriptions or photos. Coverage and data availability vary.

WHY BURBBUDDY CAN STAND OUT

Useful now. More valuable as the journey grows.

NOW

Current prototype

Built to require a unique address match, show returned estimate/range and basics, and explain when data is missing.

NEXT

Feasible roadmap

Validate one area-context card from documented Microburbs data, then add a local shortlist comparison and buyer-chosen suburb filters.

5 / 6

Waterloo addresses had one exact normalized API match in the spot-check

2 / 5

Matched addresses returned an AVM in that sample

15 / 15

Automated extension tests passed

Area context and shortlist comparison are proposed—not implemented. API results are a small dated sample, not a guarantee of live listing availability or future results.

A BUSINESS CASE WORTH TESTING

Turn useful context into a repeatable customer relationship.

Illustrative scenario · not a forecast

A$48k

Gross annual subscription revenue at 10,000 monthly active users × 5% paid conversion × A$8/month × 12.

79 paid users

Illustrative break-even at A$8/month, 80% gross margin and A$500 monthly fixed cost—before acquisition, tax and other excluded costs.

Value for Microburbs

Put property and area data into the buyer's research moment; measure activation, repeat use, field engagement and cost per useful session.

These are hypothetical assumptions, not validated pricing, conversion, costs, commercial terms or ROI. The 10,000-user base is illustrative—not a BurbBuddy audience forecast. Validate with an opt-in pilot.

Next step: approve API/commercial terms and test buyer value in a measured pilot
